Among them is how to deal with random and sometimes aggressive people. Google is developing devices like the Spruce, a magnetic bracelet that taps into a phone's light sensors to determine whether someone is standing too close, and then vibrates. The Clipper, a band that holds smartwatches in place, has a camera that can tell the difference between a person and a shoe or a piece of clothing. Google is also working on a smart ring that monitors heart rate, and a system for attaching a smartwatch to your finger. The new products come out of Google's work on Glass, a computerized eyeglass frames that project text, images, video, and music on the wearer's retina and the contents of the wearer's field of vision. In a video interview on Google+ about what was in store for Glass users in 2014, a woman known as "yoursay" asks a Glass user about how he handled a first-time encounter with a stranger on the street. "The question I have is about weird encounters," she asks. "When you first wear Glass, you can see this thing, and it's kind of hard to ignore. Have you ever been followed by people on the street? Has anyone ever approached you in a strange way?"Optimization of the synthesis of (1->3)-beta-D-glucans using a non-catalytic strategy. A novel strategy for the synthesis of (1->3)-beta-D-glucan was developed in the present study. A medium with increased phosphate concentration was adopted to improve the productivity and the yield of (1->3)-beta-D-glucan. 3-Deoxy-6-phosphoryl-D-glucose (DPG), an inexpensive phosphate source, was used in the medium. The results indicated that the increased phosphate concentration could lead to improved productivity of (1->3)-beta-D-glucan. The
