

KeyMacro is a security tool for encrypting your keys. It creates a dictionary of your keystrokes and stores it within a single.txt file, then can easily be deployed onto all of your computers for convenience. It provides options to automatically detect the default key binding for most applications, or to set up different key bindings. KeyMacro also allows you to store data within the.txt file, making it possible to encrypt and decrypt it later on. ATK is a Python script that processes files/directories (wildcards supported) and saves selected files/directories (wildcards supported) to a compressed zip archive. This tool can be used to keep track of important and/or differential files/directories within a repository. It can also be used to pack all or part of a repository into a zipped archive. Backup DB is an administration tool to protect your MySQL databases. It can create a text file that can be used to restore your MySQL database, making it much easier to restore your database if it has been corrupted (i.e. to make your MySQL database usable again). bind contains two parts: one is a server which listens to DNS queries for a given IP address, and the other is a client which connects to the server and sends all queries to it. The server part is in C++, whereas the client part is in Python and Perl. bizisit is a service for restricting the access of a web-site to authorized users based on the geographical location of the requester, e.g. in order to protect confidential information of a company that only some of its employees should be able to access. Better Way is a GUI tool to control certain services in your system and services on a remote system, such as Apache, Samba, SSH, FTP, Samba, HTTP, and NIS, etc. It's designed to allow you to control services at remote hosts, and does so by adding and removing users and groups from services (such as via SSH). It also includes the ability to view the access rights of users. Better Way is also a single-shot package which allows you to install the GUI tool, and all necessary dependencies, and then launch it as an icon in the tray. CipherLock is a small utility that can encrypt text files. CLI-Reverse is an application that will reverse all the executable 70238732e0

The Mac app KEYMACRO is basically a keyboard shortcut recorder that enables users to record keyboard shortcuts and create macros for frequent tasks or actions. A handy feature is the option to record the activities performed after the keyboard shortcut is selected. This allows for the automatic creation of a collection of keyboard shortcuts. Furthermore, you are also allowed to record the keyboard shortcut prior to its execution so as to create a shortcut that is invoked with a custom command. The app's support for folder, playlist, and text editor makes it quite versatile. You can save the macros you want to create into files, a bookmark folder, a playlist, or even a spreadsheet or text document. Recording features The app includes the following essential features that help it rank among the top free keyboard shortcut recording software: You can record all shortcuts with just one click. You can enter text into a text field or a label. The recording takes place directly in the application window so that you do not have to leave it. You can record the keyboard shortcuts that are held down by default or the ones you have defined in the settings. The current status of a recording can be checked at any time. The shortcuts are automatically saved as a list of macros. You can append more shortcuts to existing collections. You can also delete one or multiple shortcuts from your list. You can add custom keyboard shortcuts. You can add a text description to each shortcut. You can export the macros as an AppleScript list, a CSV file, a key chord file, or as a picture image. Furthermore, you can export all recorded keyboard shortcuts into a file, a playlist, or into a text document. You can use keyboard shortcuts in the same way you use regular keyboard shortcuts, and you can easily re-record a shortcut. Keyboard shortcuts are automatically saved in a list as they are recorded. App supports the following keyboard shortcut types: System keyboard shortcuts. Apple's default keyboard shortcuts, which are sometimes different from the standard Windows keyboard shortcuts. Saved keyboard shortcuts, which are shortcuts that you have already saved in the list. You can remove keyboard shortcuts from the list using the Delete key. Everytime you want to use a saved shortcut, all you have to do is just to press the corresponding key combination. App options The Mac app allows you to choose the recorded keyboard shortcuts according to the following options: Keyboard shortcut categories. You can create as many
