An image editor is a package or program that lets you modify images. It can be of two types: A software application that edits images on a computer, such as Adobe Photoshop A device, such as a tablet computer, that accepts images from a camera or scanner. Adobe Photoshop Photoshop CS5 may have been the most popular application to date, but you can use many other kinds of image editors to modify images on a computer. Photoshop CS5 isn't the only program that allows you to edit images. One of the most popular image editors out there is called Adobe Photoshop Lightroom. With Lightroom, you can edit photos in a way that takes advantage of some of Photoshop's features. Because of the amount of information in this chapter and the fact that I plan to cover the same general topics in the upcoming chapters, I chose to use Photoshop as an example. However, one of my editors, Kelly O'Kane, has written a guide, Photoshop For Dummies, from which I've taken many of my ideas — you can find it online at www.dummies.com/go/digitalphotoshop. What Photoshop Can Do for You So, what can Photoshop do for you? Here are just a few of the things you can do to your images with Photoshop: Enhance color and tonal range in your image Reduce the blue or orange cast in your image Correct color and exposure problems Improve focus in your images Adjust the overall look of your image Rotate, crop, or flip your image Apply special effects, such as blur and reflections Add special effects Save your work for a new file format Print your images at any size and using any size of paper Create and modify vector illustrations such as logos, icons, and digital art Edit digital photos from any source, including a digital camera, scanner, and your computer Extract elements from your image to use on a different element (that is, apply an object in Photoshop to a different image) 1. The first thing you need to do is to add a new document. A document is an image file type that allows you to create and save your own images. It also supports many of the tools and functions in the program. You start a new document by selecting the New Document icon from the File menu. (See Figure 1-1 to find out how to get to the File

The work piece can include excavating equipment such as backhoes, front end loaders and the like. Such equipment includes the vehicle's lift, boom, linkage and arm, with power at least partially transmitted from the vehicle's engine. The articulated arm of a loader is typically pivotally secured to the tractor frame by brackets which raise and lower the loader arm as desired. One technique to produce the lowest possible center of gravity for a heavy work piece is to elevate it. This can be done by suspending it in a floating position at a substantial distance above the vehicle's ground engaging elements such as tracks, wheelled or skid-plate elements, etc. In order to effectively elevate an excavating element it is necessary to have a mechanism for adjusting the elevation of the element. For example, the element may be attached to the boom of the excavating machine and the boom is typically locked in place by a hydraulic cylinder. The element is therefore held at a certain elevation unless a separate mechanism is provided. Thus the mechanism must move the boom to an elevated position or drop the boom to a lowered position. As shown in U.S. Pat. No. 3,683,709 to Stile, this type of mechanism employs a hydraulic cylinder and is arranged to raise and lower the boom. Such an arrangement requires the operator to raise the boom to an appropriate position and then wait for a certain amount of time before lowering the boom. The time delay provides an opportunity for the operator to observe and/or adjust the weight distribution of the element and the vehicle. It is known to use a rack and pinion arrangement for controlling the elevation of a bucket as shown in U.S. Pat. No. 2,831,725 to J. I. Ryan, Jr., et al. This arrangement is also hydraulically operated. Another type of apparatus for elevating or lowering an element attached to an arm

San Jose Earthquakes forward Steven Lenhart is in the midst of a personal war with cancer, and has shed 20 pounds in the past several months. However, the 28-year-old American is clearly fighting on and used his status as an established MLS veteran Wednesday night to score his third goal of the season. In a game between the Quakes and Vancouver Whitecaps, Lenhart put the match away in the 54th minute, uncharacteristically drilling a shot from roughly 30 yards out to beat goalkeeper Joe Cannon. In the 93rd minute, in his first touch since scoring, Lenhart received a kick to his head from former teammate Shea Salinas, but remained on the pitch, grinding out the game's final five minutes for the Earthquakes, who won 1-0. Lenhart's goal was his first since May 2, 2013. Both Lenhart and Salinas currently rank in the Quakes' all-time top 10 in goals, as well as league points, and both players will be missed should Lenhart miss the 2014 season for any reason. Brett Goddard contributed to this report. The present invention pertains to valve construction generally, and more particularly, to a fastening arrangement for securing a valve body to a valve base. A known valve construction is shown in FIGS. 1-3. As shown, a valve body 10 is secured to a base 12 with a conventional securing arrangement. The valve body 10 is typically formed of a metal such as brass or steel. The base 12 is typically formed of a plastic material such as polypropylene, phenolic resin, or a phenolic composite material. However, other materials such as aluminum or steel may be used. The valve body 10 and base 12 are formed as a single integral unit, which facilitates their assembly. The valve body 10 defines a tapered recess 14. The recess 14 has a tapered, frusto-conical shape, and may be formed by a cavity defined between opposing mold cores. The recess 14 receives a seal cartridge 16 of a corresponding valve body. The seal cartridge 16 is inserted into the recess 14 prior to securing the valve body 10 to the base 12. Accordingly, the seal cartridge 16 is positioned at the upper end of the recess 14. A coupling interface 18 is formed between the valve body 10 and the base 12 to facilitate securing the valve body to the base. The coupling interface 18 is defined by an upper surface 20 of the valve
